Comparison of digital imaging modalities

In a recent digital imaging system modality study, Veterinary Radiologists could not reliably determine if an image was obtained from a CR unit, CCD system, or DR Flat Panel Detector because the image quality from these "top end" systems in different digital modality classifications all generated similar diagnostic quality images.

Now your choice is made clear. Based on your practice you can pick the imaging modality that fits your needs at a price you can afford from a company with 28 years of sales and service expertise.
